## Chapter 3: Processes

Assignment Project Exam Help

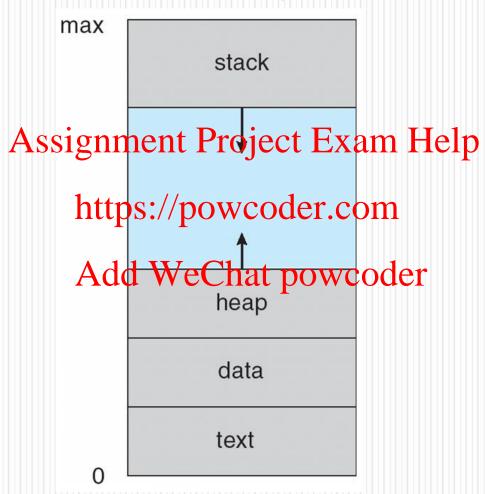

https://powcoder.com

Add WeChat powcoder

## **Process Concept**

- **Process** a program in execution; process execution must progress in sequential fashion
- Multiple parts
  - The program code, also called text section
  - Current Action In Project Example processor registers
  - Stack containing temporary data
    https://powcoder.com
    Function parameters, return addresses, local variables
  - Data section Applation global pariables ler
  - Heap containing memory dynamically allocated during run time
- Program is *passive* entity stored on disk (executable file), process is active
  - Program becomes process when executable file loaded into memory
- One program can be several processes
  - Consider multiple users executing the same program

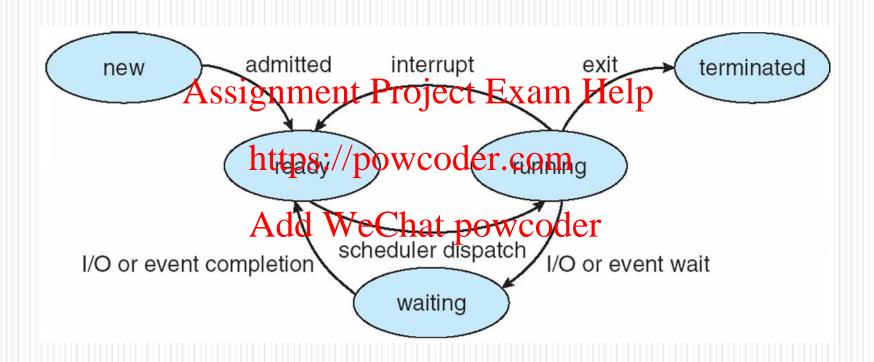

## Process in Memory

#### **Process State**

- As a process executes, it changes state
  - **new**: The process is being created
  - running: Instructions are being executed ASSIGNMENT Project Exam Help
  - waiting: The process is waiting for some event to occur <a href="https://powcoder.com">https://powcoder.com</a>
  - ready: The process is waiting to be assigned to a Add WeChat powcoder processor
  - terminated: The process has finished execution

## Diagram of Process State

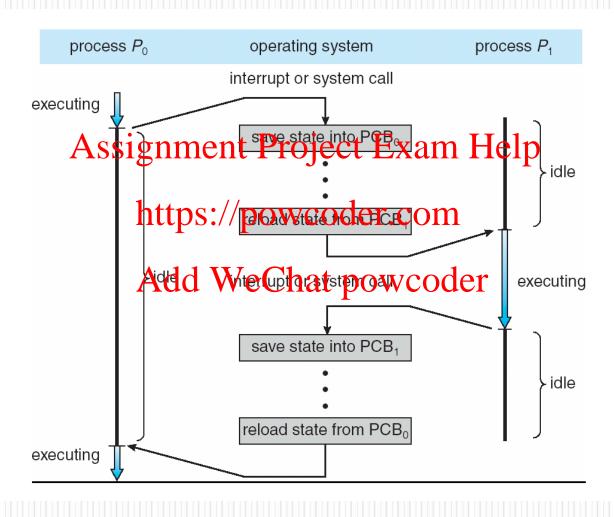

## Process Control Block (PCB)

Information associated with each process (also called task control block)

- Process state running, waiting, etc
- Program counting nineation of the Prog
- CPU registers contents of all processcentric registers Add WeChat powcoder
- CPU scheduling information- priorities, scheduling queue pointers
- Memory-management information memory allocated to the process
- I/O status information I/O devices allocated to process, list of open files

process state process number program counter registers memory limits list of open files

#### **CPU Switch From Process to Process**

## Process Scheduling

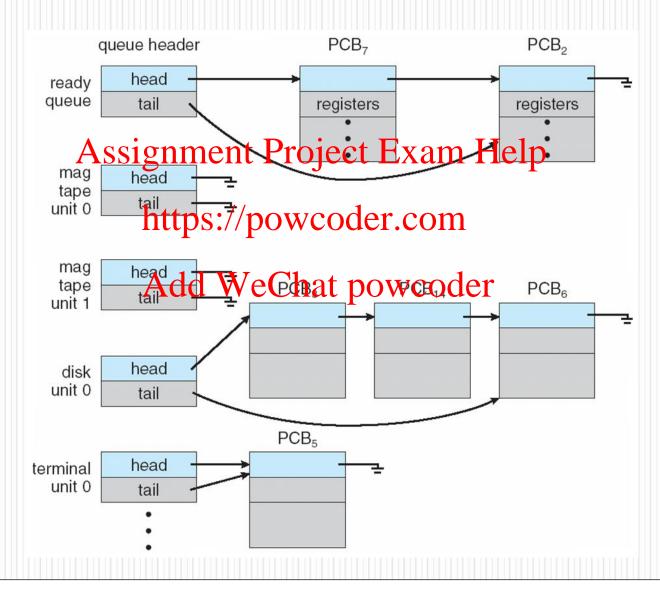

- Maximize CPU use, quickly switch processes onto CPU for time sharing
- Process scheduler Selects among available processes for next execution on CPII
- Maintains scheduling queues of processes

  Add WeChat powcoder

   Job queue set of all processes in the system

  - Ready queue set of all processes residing in main memory, ready and waiting to execute
  - Device queues set of processes waiting for an I/O device
  - Processes migrate among the various queues

# Ready Queue And Various I/O Device Queues

## Representation of Process Scheduling

Queueing diagram represents queues, resources, flows

#### Schedulers

- Long-term scheduler (or job scheduler) selects which processes should be brought into the ready queue - The long-term scheduler controls the degree of multiprogramming - Long-term scheduler is invoked very infrequently (seconds, minutes)  $\Rightarrow$  (may be slow)
- Short-term scheduler (or CPU scheduler)—selects which process should be executed next and allocates CPU Sometimes the only scheduler in a systempsshoowooderedom is invoked very frequently (milliseconds)  $\Rightarrow$  (must be fast)

  Add WeChat powcoder

  Processes can be described as either:
- - I/O-bound process spends more time doing I/O than computations, many short CPU bursts
  - **CPU-bound process** spends more time doing computations; few very long CPU bursts
- Long-term scheduler strives for good *process mix*

## Addition of Medium Term Scheduling

- Medium-term scheduler can be added if degree of multiple programming needs to decrease
  - Remove process from memory, store on disk, bring back in from disk to continue execution: swapping

Assignment Project Exam Help

#### **Context Switch**

- When CPU switches to another process, the system must save the state of the old process and load the saved state for the new process via a context Assignment Project Exam Help switch
- Context of https://poweedatedomthe PCB
- Context-switch time is overhead; the system does no useful work while switching
  - The more complex the OS and the PCB -> longer the context switch
- Time dependent on hardware support
  - Some hardware provides multiple sets of registers per CPU -> multiple contexts loaded at once

#### **Context Switch**

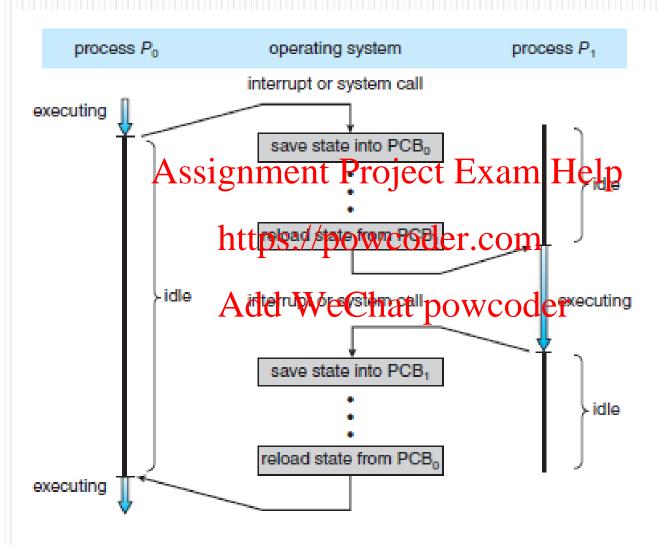

Figure 3.6 Diagram showing context switch from process to process.

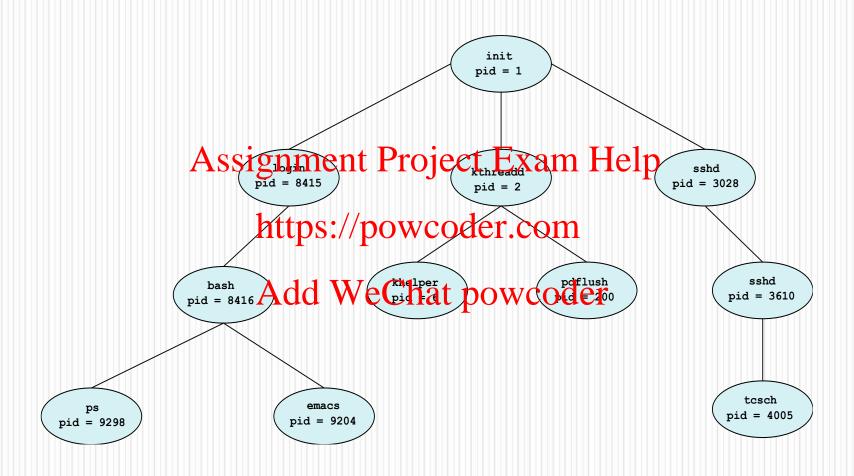

#### **Process Creation**

- Parent process create children processes, which, in turn create other processes, forming a tree of processes
- Generally, process identified and managed via a process identifier (pid) and Project Exam Help

#### https://powcoder.com

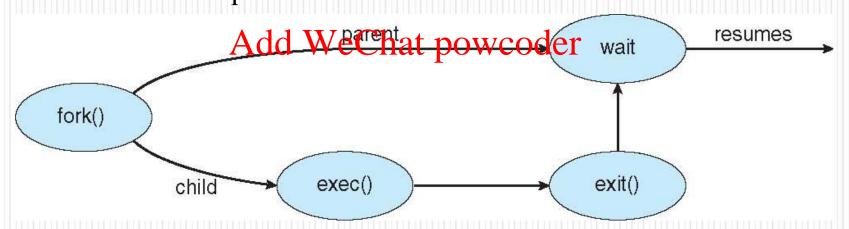

- Resource sharing options
  - Parent and drill We Chat apowcoder
  - Children share subset of parent's resources
  - Parent and child share no resources
- Execution options
  - Parent and children execute concurrently
  - Parent waits until children terminate

#### A Tree of Processes in Linux

## Process Creation (Cont.)

- Address space
  - Child duplicate of parent
  - Child has a program loaded into it Assignment Project Exam Help
- UNIX exampteps://powcoder.com

## C Program Forking Separate Process

```
#include <sys/types.h>
    #include <stdio.h>
    #include <unistd.h>
    int main()
    pid_t pid;
Assignment Project Exam Help
       pid = fork();
      https://powcoder.com/
         fprintf(stderr, "Fork Failed");
      Add WeChat powcoder
       else if (pid == 0) { /* child process */
         execlp("/bin/ls", "ls", NULL);
       else { /* parent process */
         /* parent will wait for the child to complete */
         wait(NULL);
         printf("Child Complete");
       return 0;
```

#### **Process Termination**

- Process executes last statement and asks the operating system to delete it (exit())
  - Output data from child to parent (via wait())
  - Process' resources are deallocated by operating Assignment Project Exam Help
- Parent may tempinatpoxecotion of children processes (abort())
  - Add WeChat powcoder
     Child has exceeded allocated resources
  - Task assigned to child is no longer required
  - If parent is exiting
    - Some operating systems do not allow child to continue if its parent terminates
      - All children terminated cascading termination

#### **Process Termination**

• Wait for termination, returning the pid:

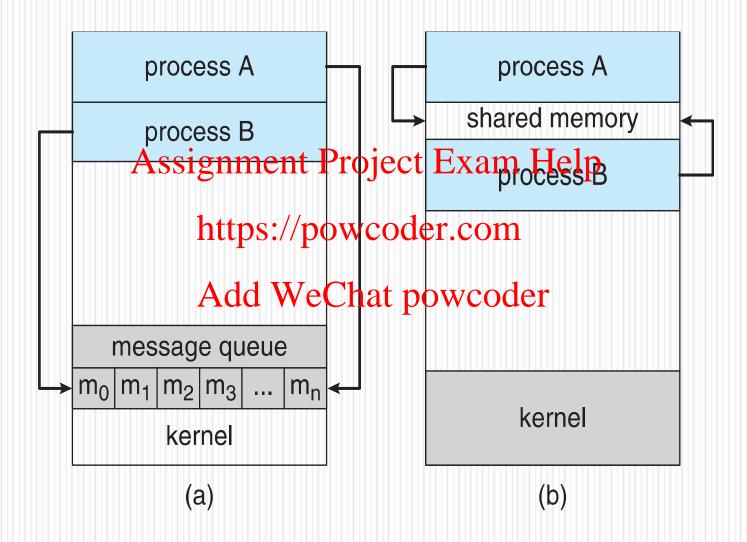

```
pid t_pid; int status;
pid = wait(&status)ect Exam Help
```

- If no parent waiting, then terminated process is a <a href="https://powcoder.com">ttps://powcoder.com</a>
- If parent terminated, processes we odehans

## Interprocess Communication

- Processes within a system may be independent or cooperating
- Cooperating process can affect or be affected by other processes, including sharing data
- Reasons for constiguing onto description to the Reasons for constiguing onto description and the Reasons for constiguing onto description and the Reasons for constiguing onto description and the Reasons for constitution and the Reasons for the Reasons for
  - Information sharing https://powcoder.com
  - Computation speedup
  - Modularity Add WeChat powcoder
  - Convenience
- Cooperating processes need interprocess communication (IPC)
- Two models of IPC
  - **Shared memory**
  - Message passing

#### **Communications Models**

### Message Passing Vs. Shared Memory

#### Message passing:

- Useful for exchanging smaller amounts of data
- Easier to implement
- Implemented Assing system Project Exam Help
- Every message requires kernel intervention slower https://powcoder.com

#### Shared memory: Add WeChat powcoder

- Useful for exchanging larger amounts of data
- Requires synchronization
- System calls are only required to set up shared-memory region
- Once set up, all accesses are routine memory accesses, no further kernel assistance required faster

## Cooperating Processes

• *Independent* process cannot affect or be affected by the execution of another process

#### Assignment Project Exam Help

• Cooperating process can affect or be affected by the execution of another process can affect or be affected by the

#### Add WeChat powcoder

- Advantages of process cooperation
  - Information sharing
  - Computation speed-up
  - Modularity
  - Convenience

#### Producer-Consumer Problem

Paradigm for cooperating processes, producer
 process produces information that is consumed by a consumer process

a consumer process

Assignment Project Exam Help
unbounded-buffer places no practical limit
on the size of the buffer coder.com

 bounded-buffer assumes that there is a fixed buffer sizedd WeChat powcoder

#### Bounded-Buffer - Shared-Memory Solution

Shared data

```
#define BUFFER_SIZE 10

Assignment Project Exam Help

https://powcoder.com

AddeWechtatrpowcodesIZE];

int in = 0;

int out = 0;
```

• Solution is correct, but can only use BUFFER\_SIZE-1 elements

#### Bounded-Buffer - Producer

```
item next produced;
while (trassignment Project Exam Help
   /* produce an item in next produced */
https://powcoder.com
while (((in + 1) % BUFFER SIZE) == out)
       ; /* do Add We Chat powcoder
   buffer[in] = next produced;
    in = (in + 1) % BUFFER SIZE;
```

#### Bounded Buffer - Consumer

```
item next consumed;
while (true) {
                                                                     whi Assignment Project Exam Help
                                                                    ; /* do nothing */
next consume consume confine confin
                                                                     out = Add Wethat powered size;
                                                                      /* consume the item in next
consumed */
```

#### Interprocess Communication - Message Passing

- Mechanism for processes to communicate and to synchronize their actions
- Message system processes communicate with each other without resorting to shared variables
- without resorting to shared variables
   IPC facility provides two operations:
  - send(messinge)psmessage sizelfixedom variable
  - receive(message)
- If P and Q wish to communicate, Phey spectro:
  - establish a communication link between them
  - exchange messages via send/receive
- Implementation of communication link
  - physical (e.g., shared memory, hardware bus)
  - logical (e.g., direct or indirect, synchronous or asynchronous, automatic or explicit buffering)

## Implementation Questions

- How are links established?
- Can a link be associated with more than two processes?
- How many lights cent throjec between Help pair of communicating processes?
- What is the capacity of a link?
- Is the size of Addes MgChattpolir todoraccommodate fixed or variable?
- Is a link unidirectional or bi-directional?

#### **Direct Communication**

- Processes must name each other explicitly:
  - **send** (*P, message*) send a message to process P
  - receive (Q. message) receive a message from Assignment Project Exam Help process Q

#### https://powcoder.com

- Properties of communication link
  Add WeChat powcoder

   Links are established automatically

  - A link is associated with exactly one pair of communicating processes
  - Between each pair there exists exactly one link
  - The link may be unidirectional, but is usually bidirectional

#### Indirect Communication

- Messages are directed and received from mailboxes (also referred to as ports)
  - Each mailbox has a unique id
  - Processes can communicate only if they share a Assignment Project Exam Help mailbox

#### https://powcoder.com

- Properties of communication link
   Add WeChat powcoder
   Link established only if processes share a common
  - Link established only if processes share a common mailbox
  - A link may be associated with many processes
  - Each pair of processes may share several communication links
  - Link may be unidirectional or bi-directional

#### Indirect Communication

- Operations
  - create a new mailbox
  - send and receive messages through mailbox Assignment Project Exam Help
  - destroy a mailbox

https://powcoder.com

Primitives are defined as a powcoder send(A, message) — send a message to mailbox A
 receive(A, message) — receive a message from mailbox A

#### Indirect Communication

- Mailbox sharing
  - $P_1$ ,  $P_2$ , and  $P_3$  share mailbox A
  - P<sub>1</sub> sends: P<sub>2</sub> and P<sub>3</sub> receive Exam Help
  - Who gets the message?

https://powcoder.com

- Solutions Add WeChat powcoder
  - Allow a link to be associated with at most two processes
  - Allow only one process at a time to execute a receive operation
  - Allow the system to select arbitrarily the receiver. Sender is notified who the receiver was.

## Synchronization

- Message passing may be either blocking or non-blocking
- Blocking is Aconisident Project Exam Help
  - Blocking send has the sender block until the message is received https://powcoder.com
    Blocking receive has the receiver block until a message is available

#### Add WeChat powcoder

- Non-blocking is considered asynchronous
  - Non-blocking send has the sender send the message and continue
  - Non-blocking receive has the receiver receive a valid message or null

# Solution to Producer-Consumer Problem using Blocking Send() and Receive()

```
message next produced;
while (true) Assignment Project Exam Help
  Add WeChat powcoder
message next consumed;
while (true) {
   receive (next consumed);
   /* consume the item in next consumed */
```

## Buffering

- Queue of messages attached to the link; implemented in one of three ways
  - 1. Zero capacity 0 messages
    Assignment Project Exam Help
    Sender must wait for receiver (rendezvous)
  - 2. Bounde type into dength messages Sender must wait if link full
  - 3. Unbounded capacity—Infinite length
    Sender never waits

#### Communications in Client-Server Systems

Sockets

• Remotalsoject Exam Help

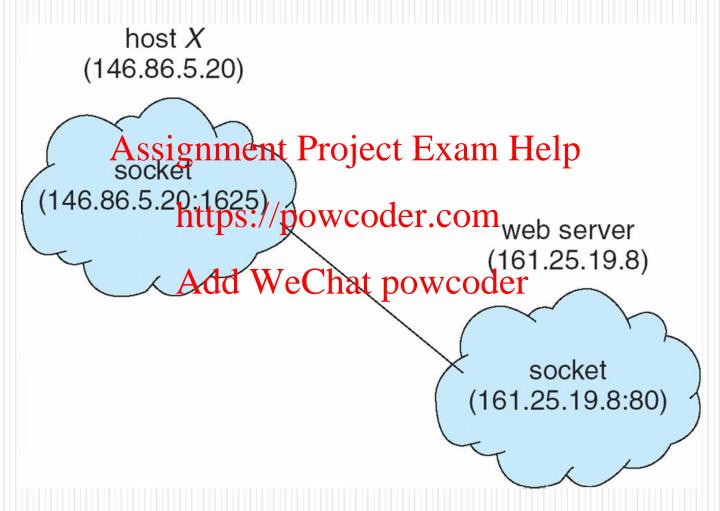

https://powcoder.com

Add WeChat powcoder

#### Sockets

- A **socket** is defined as an endpoint for communication
- Concatenation of IP address and port a number included at start of message packet to differentiate network services on a host
- The socket 161.25.19.8: P625 Cefer to port 1625 on host 161.25.19.8 Add WeChat powcoder
- Communication consists between a pair of sockets
- All ports below 1024 are *well known*, used for standard services

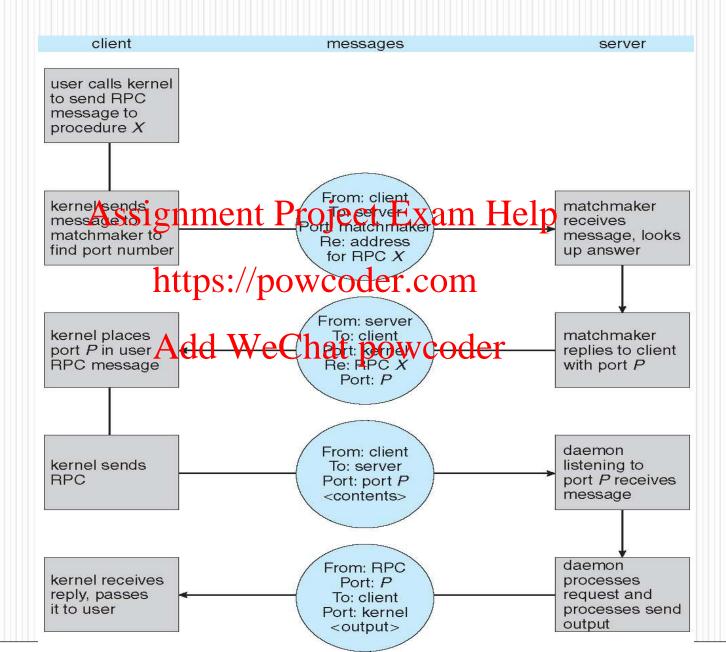

#### **Socket Communication**

#### Remote Procedure Calls

- Remote procedure call (RPC) abstracts procedure calls between processes on networked systems
  - Again uses ports for service differentiation
- Stubs client side proxy for the actual procedure on the server
- The client-side stub locates the server and marshalls the parameters <a href="https://powcoder.com">https://powcoder.com</a>
   The server-side stub receives this message, unpacks the marshalled
- The server-side stub receives this message, unpacks the marshalled parameters, and performs whe phrate purventer server
- Data representation handled via External Data Representation
   (XDL) format to account for different architectures
- Remote communication has more failure scenarios than local
  - Messages can be delivered *exactly once* rather than *at most once*
- OS typically provides a rendezvous (or **matchmaker**) service to connect client and server

#### **Execution of RPC**

## End of Chapter 3 Assignment Project Exam Help
